

MOTHERBOARD AND CPU THEORY

1. Draw a labeled diagram of an ATX motherboard and mark at least 8 different slots and ports (such as RAM slots, PCIe slots, SATA ports, USB headers, CPU socket, power connector, etc.).

ANS;

2. Research and list 3 popular CPU socket types (for example: LGA1151, AM4, LGA1200) and name one compatible CPU model for each.

ANS:

CPU Socket Type	Compatible CPU Model
1.LGA1151	Intel Core i7-9700k

2.AM4	AMD Ryzen 5 5600k
3.LGA1200	Intel core i5-10400

3.Explain in your own words the primary functions of the CPU and the chipset on a motherboard, and describe how they work together when you open a music app like Spotify.

ANS:

CPU:

The CPU is the brain of the computer. It processes instructions and runs programs.

Chipset:

The chipset connects the CPU with RAM, storage, USB ports, and other hardware. It helps all parts communicate.

Example:

Opening Spotify

You click the Spotify icon.

The CPU starts the app.

The chipset gets the required data from the SSD and RAM.

The CPU loads Spotify, and the chipset sends the music to the speakers.

4.Find a clear photo of a real motherboard (from the internet or your own device), and identify at least 5 different ports or slots by circling them and labeling each one.

AND:
